Current:

Solution =
ML Expertise + Data + Computation

Current:

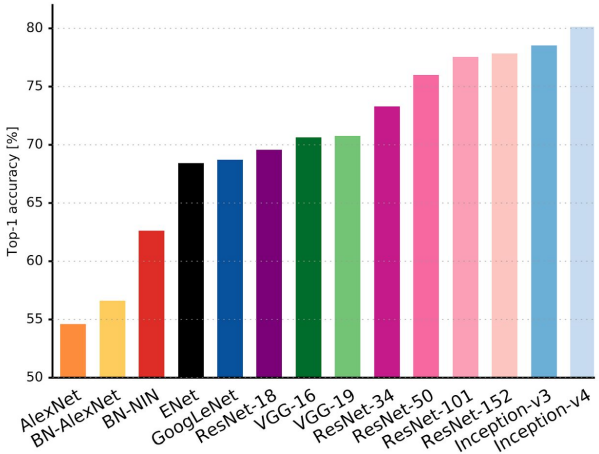
Solution =
ML Expertise + Data + Computation

But can we turn this into:

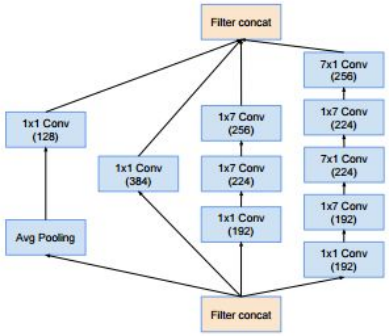
Solution =
Data + 100X Computation

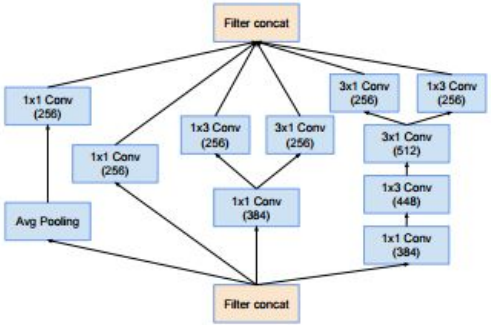
Importance of architectures for Vision

- Designing neural network architectures is hard
- Lots of human efforts go into tuning them
- There is not a lot of intuition into how to design them well
- Can we try and learn good architectures automatically?



Canziani et al, 2017



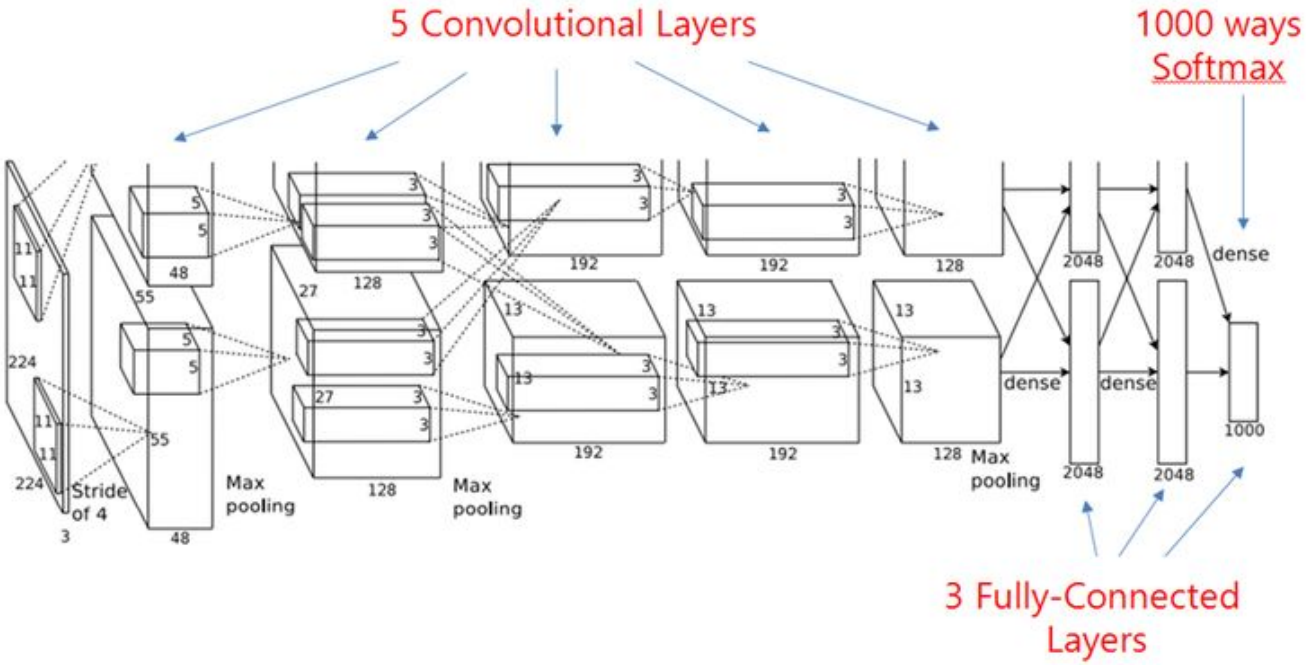


Two layers from the famous Inception V4 computer vision model.

Szegedy et al, 2017

Google

Convolutional Architectures

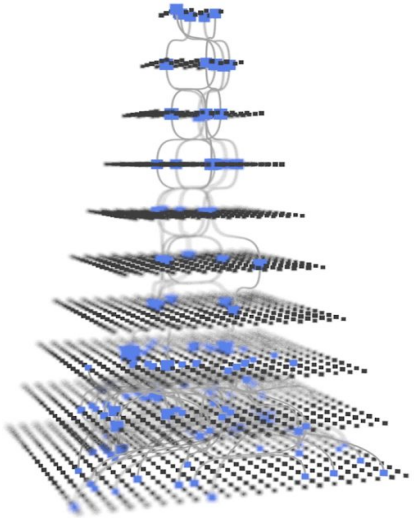


Krizhevsky et al, 2012

Neural Architecture Search

- Key idea is that we can specify the structure and connectivity of a neural network by using a configuration string
  - [“Filter Width: 5”, “Filter Height: 3”, “Num Filters: 24”]
- Our idea is to use a RNN (“Controller”) to generate this string that specifies a neural network architecture
- Train this architecture (“Child Network”) to see how well it performs on a validation set
- Use reinforcement learning to update the parameters of the Controller model based on the accuracy of the child model

Controller: proposes ML models

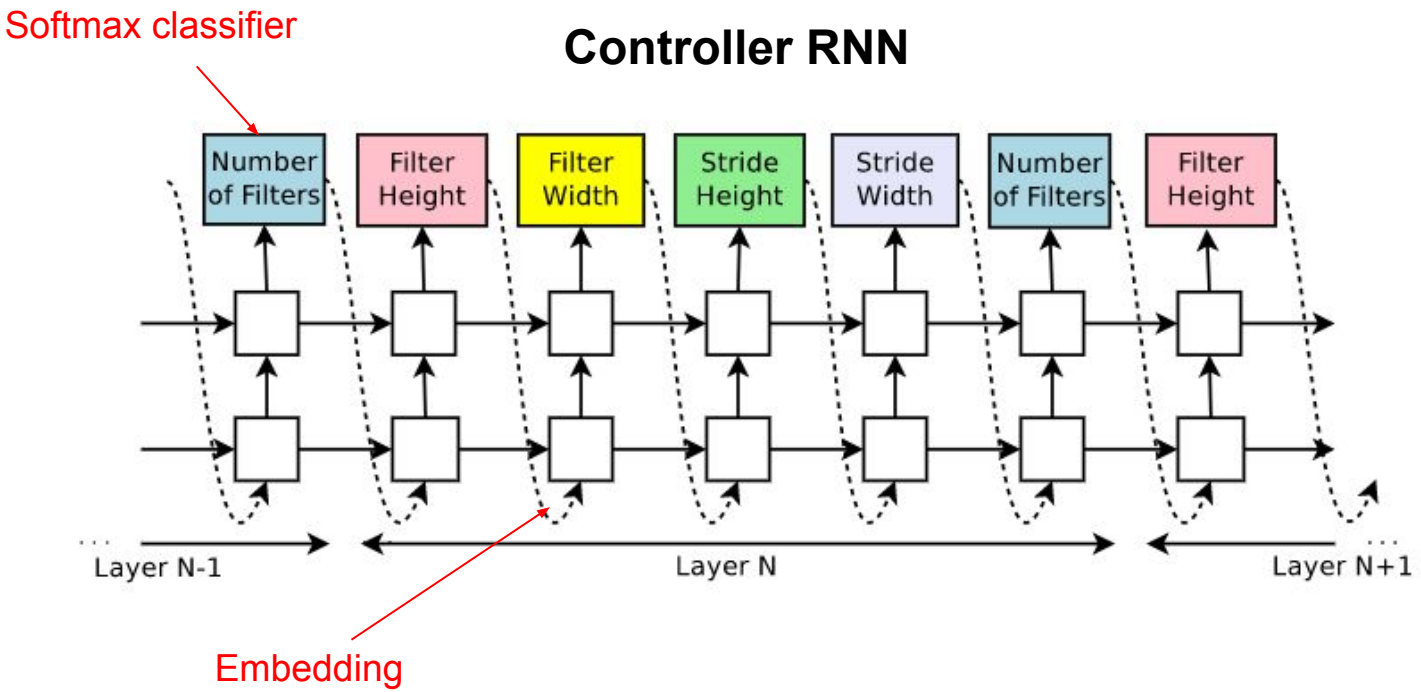


20K times

Iterate to find the most accurate model

Train & evaluate models

Neural Architecture Search for Convolutional Networks



Training with REINFORCE

$$J(\theta_c) = E_{P(a_{1:T};\theta_c)}[R]$$

Training with REINFORCE

Parameters of Controller RNN

Accuracy of architecture on held-out dataset

$$J(\theta_c) = E_{P(a_{1:T};\theta_c)}[R]$$

Architecture predicted by the controller RNN viewed as a sequence of actions

Training with REINFORCE

Parameters of Controller RNN

Accuracy of architecture on held-out dataset

$$J(\theta_c) = E_{P(a_{1:T};\theta_c)}[R]$$

Architecture predicted by the controller RNN viewed as a sequence of actions

$$\nabla_{\theta_c} J(\theta_c) = \sum_{t=1}^{T} E_{P(a_{1:T};\theta_c)}\big[\nabla_{\theta_c} \log P(a_t | a_{(t-1):1}; \theta_c) R\big]$$

Training with REINFORCE

Parameters of Controller RNN

Accuracy of architecture on held-out dataset

$$J(\theta_c) = E_{P(a_{1:T};\theta_c)}[R]$$

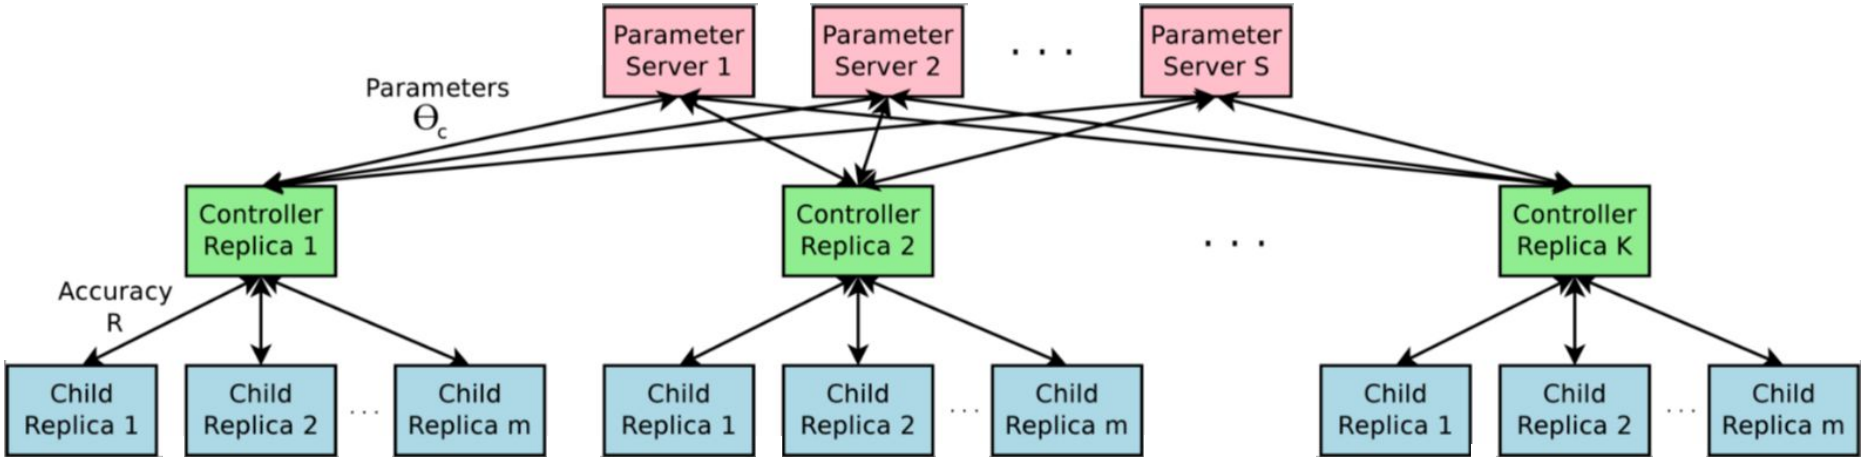
Architecture predicted by the controller RNN viewed as a sequence of actions

$$\nabla_{\theta_c} J(\theta_c) = \sum_{t=1}^{T} E_{P(a_{1:T};\theta_c)}\big[\nabla_{\theta_c} \log P(a_t|a_{(t-1):1};\theta_c)R\big]$$

Number of models in minibatch

$$\frac{1}{m}\sum_{k=1}^{m}\sum_{t=1}^{T} \nabla_{\theta_c} \log P(a_t|a_{(t-1):1};\theta_c)R_k$$

Distributed Training



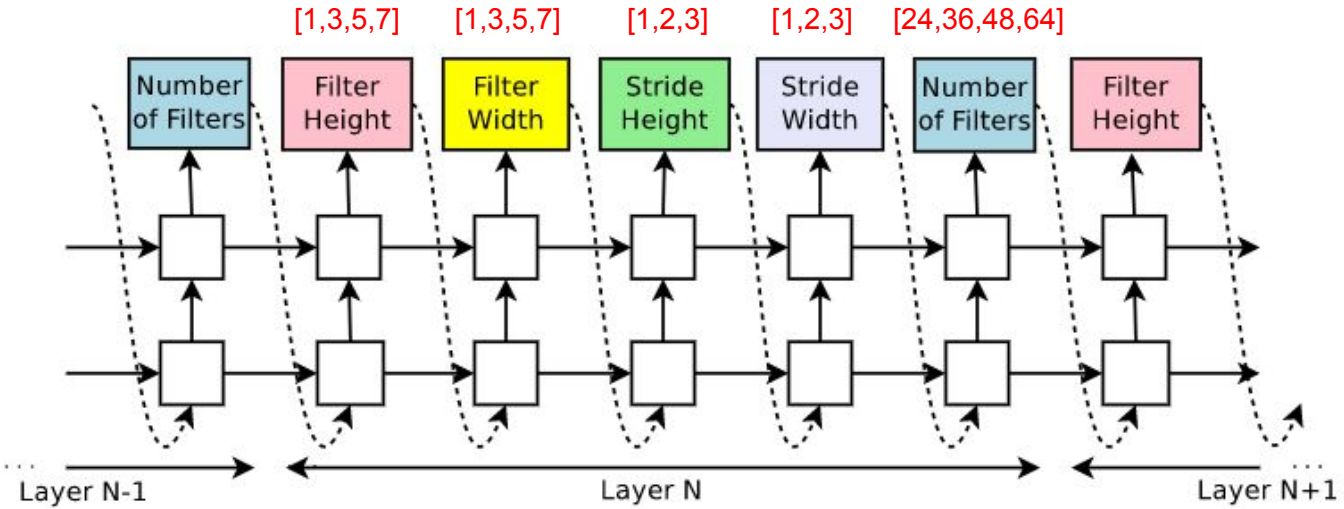
Overview of Experiments

- Apply this approach to Penn Treebank and CIFAR-10
- Evolve a convolutional neural network on CIFAR-10 and a recurrent neural network cell on Penn Treebank
- Achieve SOTA on the Penn Treebank dataset and almost SOTA on CIFAR-10 with a smaller and faster network
- Cell found on Penn Treebank beats LSTM baselines on other language modeling datasets and on machine translation

Neural Architecture Search for CIFAR-10

- We apply Neural Architecture Search to predicting convolutional networks on CIFAR-10
- Predict the following for a fixed number of layers (15, 20, 13):
  - Filter width/height
  - Stride width/height
  - Number of filters

Neural Architecture Search for CIFAR-10



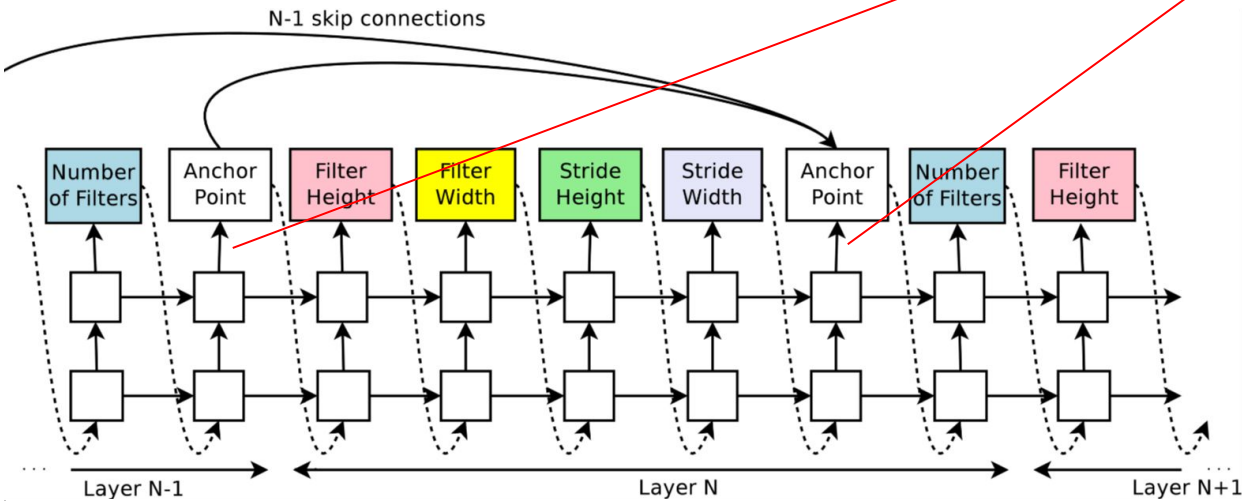
CIFAR-10 Prediction Method

- Expand search space to include branching and residual connections
- Propose the prediction of skip connections to expand the search space
- At layer N, we sample from N-1 sigmoids to determine what layers should be fed into layer N
- If no layers are sampled, then we feed in the minibatch of images
- At final layer take all layer outputs that have not been connected and concatenate them

Neural Architecture Search for CIFAR-10

Weight Matrices

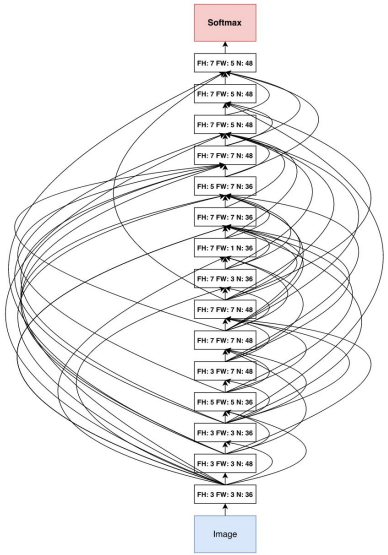
$$\mathrm{P}(\text{Layer j is an input to layer i}) = \mathrm{sigmoid}(v^{\mathrm{T}}\tanh(W_{prev} * h_j + W_{curr} * h_i))$$



CIFAR-10 Experiment Details

- Use 100 Controller Replicas each training 8 child networks concurrently
- Method uses 800 GPUs concurrently at one time
- Reward given to the Controller is the maximum validation accuracy of the last 5 epochs squared
- Split the 50,000 Training examples to use 45,000 for training and 5,000 for validation
- Each child model was trained for 50 epochs
- Run for a total of **12,800** child models
- Used curriculum training for the Controller by gradually increasing the number of layers sampled

Neural Architecture Search for CIFAR-10



Model	Depth	Parameters	Error rate (%)
Network in Network (Lin et al., 2013)	-	-	8.81

$g - \text{clip}(g^2, 10^{-4})$	93.4	92.8	93.7	92.8
$e^g - e^{\hat{m}}$	93.2	92.5	93.5	93.1
$\text{drop}(\hat{m}, 0.3) * e^w$	93.2	93.0	93.5	93.2

Table 1. Performance of Neural Optimizer Search and standard optimizers on the Wide-ResNet architecture (Zagoruyko & Komodakis, 2016) on CIFAR-10. Final Val and Final Test refer to the final validation and test accuracy after for training for 300 epochs. Best Val corresponds to the best validation accuracy over the 300 epochs and Best Test is the test accuracy at the epoch where the validation accuracy was the highest.

Neural Optimizer Search using Reinforcement Learning,
Irwan Bello, Barret Zoph, Vijay Vasudevan, and Quoc Le. ICML 2017

Neural Architecture Search for ImageNet

- Neural Architecture Search directly on ImageNet is expensive
- Key idea is to run Neural Architecture Search on CIFAR-10 to find a “cell”
- Construct a bigger net from the “cell” and train the net on ImageNet

Architecture

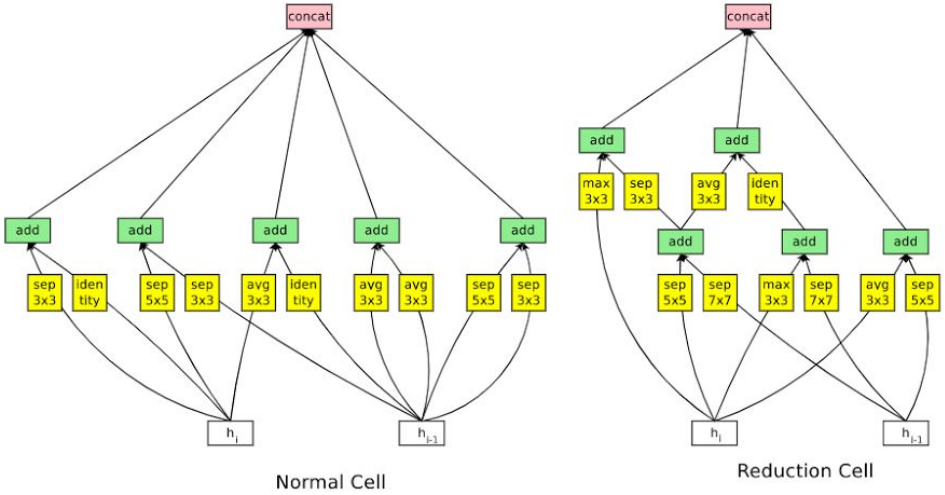
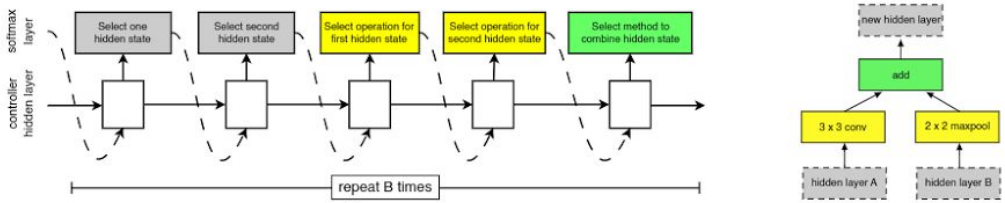
Neural Architecture Search for ImageNet



How the cell was found



Step 1. Select a hidden state from h or from the set of hidden states created in previous blocks.

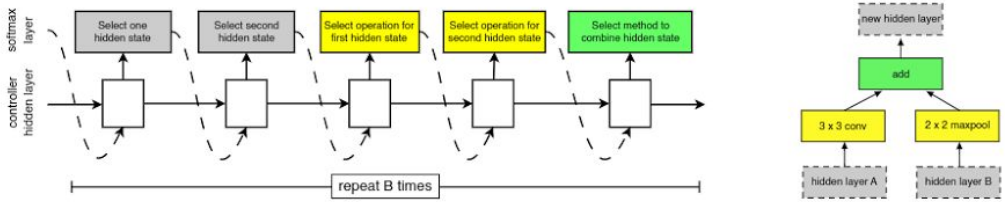
Step 2. Select a second hidden state from the same options as in Step 1.

Step 3. Select an operation to apply to the hidden state selected in Step 1.

Step 4. Select an operation to apply to the hidden state selected in Step 2.

Step 5. Select a method to combine the outputs of Step 3 and 4 to create a new hidden state.

How the cell was found



Step 1. Select a hidden state from h or from the set of hidden states created in previous blocks.

Step 2. Select a second hidden state from the same options as in Step 1.

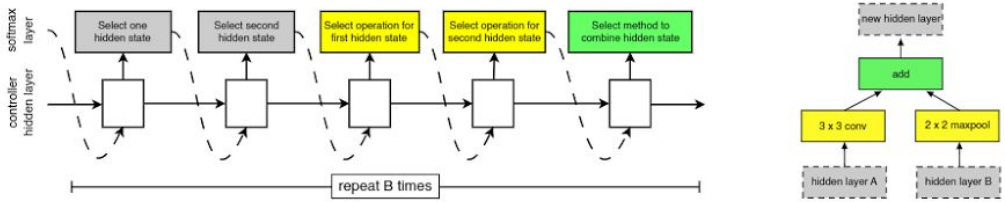
Step 3. Select an operation to apply to the hidden state selected in Step 1.

Step 4. Select an operation to apply to the hidden state selected in Step 2.

Step 5. Select a method to combine the outputs of Step 3 and 4 to create a new hidden state.

- identity
- 1x7 then 7x1 convolution
- 3x3 average pooling
- 5x5 max pooling
- 1x1 convolution
- 3x3 depthwise separable convolution
- 7x7 depthwise separable convolution
- 1x3 then 3x1 convolution
- 3x3 dilated convolution
- 3x3 max pooling
- 7x7 max pooling
- 3x3 convolution
- 5x5 depthwise separable convolution

How the cell was found



Step 1. Select a hidden state from h or from the set of hidden states created in previous blocks.

Step 2. Select a second hidden state from the same options as in Step 1.

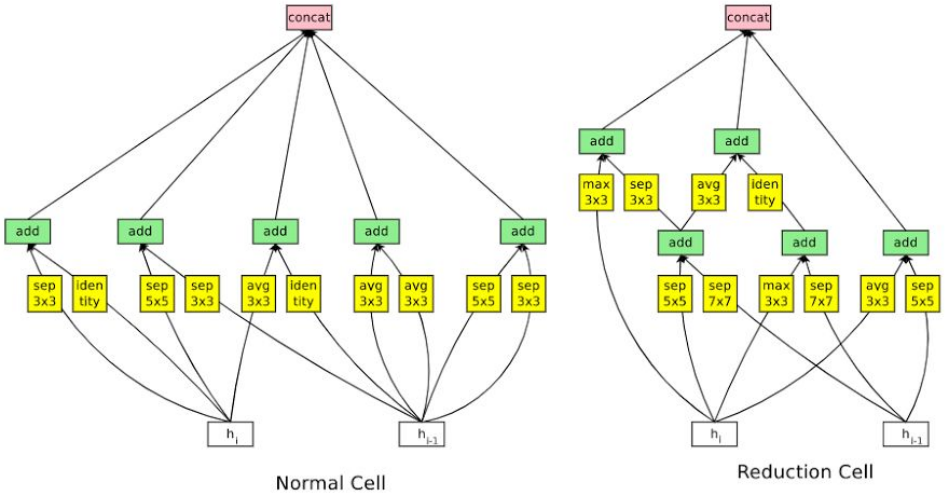
Step 3. Select an operation to apply to the hidden state selected in Step 1.

Step 4. Select an operation to apply to the hidden state selected in Step 2.

Step 5. Select a method to combine the outputs of Step 3 and 4 to create a new hidden state.

1. Elementwise addition
2. Concatenation along the filter dimension

The cell again



Performance of cell on CIFAR-10

Model	Depth	# parameters	Error rate (%)
DenseNet ($L = 40, k = 12$) [23]	40	1.0M	5.24
DenseNet($L = 100, k = 12$) [23]	100	7.0M	4.10

Performance of Neural Architecture Search and other state-of-the-art models on CIFAR-10.

Performance of cell on ImageNet

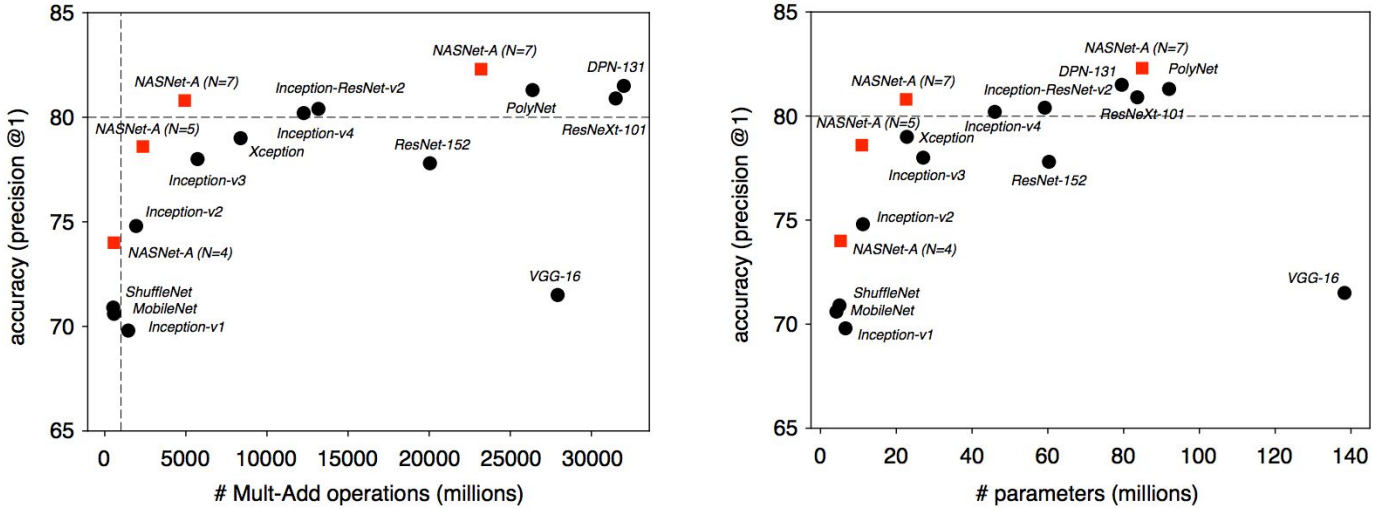

Figure 5: Accuracy versus computational demand (left) and number of parameters (right) across top performing CNN architectures on ImageNet 2012 ILSVRC challenge prediction task (compiled as of July 2017). Computational demand is measured in the number of floating-point multiply-add operations to process a single image. Black circles indicate previously published work and red squares highlight our proposed models. Vertical dashed line indicates 1 billion multiply-add operations. Horizontal dashed line indicates 80% precision@1 prediction accuracy.
